What is the Inuvialuit Final Agreement?

How has management changed?

The most significant change is the direct, and guaranteed, involvement of Inuvialuit in the management of both renewable and non-renewable resources in the Inuvialuit Settlement Region. Over the entire Region, protection of traditional lifestyles and the environment is of primary importance. Development must minimize environmental degradation and project sponsors are financially responsible and liable for damage caused to wildlife, habitat and traditional activities. The Inuvialuit and the governments of Canada, the Northwest Territories and the Yukon share management responsibilities in the Inuvialuit Settlement Region. To enhance cooperative management (co-management) between these parties, five joint Inuvialuit-Government bodies were established as a result of the Inuvialuit Final Agreement. Government and Inuvialuit interests are equally represented in each group has equal appointees from government and the Inuvialuit. An impartial, non-government person acceptable to both government and the Inuvialuit, chairs each of the co-management bodies.

Co-management in the Western Arctic and Yukon North Slope

the Inuvialuit Final Agreement

Kevin Bill—FJMC

Wildlife Management Advisory Council (Northwest Territories)

Six members, representing Canada, the Government of the Northwest Territories and the Inuvialuit, form the WMAC (NWT) together with its Chair. The Chair is appointed by the Government of the NWT with consent of the Inuvialuit and Canada. Responsible for the area of the Inuvialuit Settlement Region that falls within the Northwest Territories, (the Western Arctic Region) the Council provides advice to federal and territorial government ministers on all issues relating to wildlife in that Region.

Central to the WMAC (NWT)'s activities has been the production of the Inuvialuit Renewable Resources Conservation and Management Plan. This plan outlines goals and principles for conservation in the Western Arctic Region.

Complementing the overall Regional Plan are six community-specific conservation plans. Through these efforts, the Council is supporting Inuvialuit interests for environmental protection and resource conservation while also maintaining traditional lifestyles.

Through the Canadian Wildlife Service and the Department of Environment and Natural Resources, Government of the Northwest Territories, the Council is involved in research on various species of wildlife such as polar bears, caribou and migratory waterfowl. Inuvialuit knowledge is also gathered and helps set research priorities. The WMAC (NWT) considers the development, design, conduct, and interpretation of research on the basis of both Inuvialuit and scientific knowledge. The information gathered is used by the Council to determine and recommend appropriate quotas for Inuvialuit harvesting in the Western Arctic Region. Working together, the Council, the Inuvialuit and the government agencies ensure wildlife conservation and environmental protection.

Parks Canada

Environmental Impact Screening Committee

The Environmental Impact Screening Committee (EISC) has a Chair and six members. Three of the members are appointed by the Inuvialuit Game Council. The governments of Canada, the Yukon and the Northwest Territories also each designate one member and Canada appoints the designated members. The Chair is appointed by the Government of Canada with the consent of the Inuvialuit Game Council.

The primary responsibility of the Screening Committee is to determine if proposed developments could have a significant negative environmental impact on the Inuvialuit Settlement Region, or a significant negative impact on present or future Inuvialuit wildlife harvesting. Each developer has to submit a project description to the Screening Committee for screening. If the Screening Committee determines that a development could have a significant negative environmental impact it can recommend terms and conditions to mitigate the potential impact. Where the EISC determines that the development could have a significant negative impact it is subject to a further assessment and review. No government licenses or approvals may be issued before the Screening Committee has completed its review.

Since the Committee was established in 1986, over 700 development proposals have been screened. These projects have ranged from oil and gas seismic and drilling programs to commercial river trips. A standardized system for screening, developed by the Committee, has led to prompt and consistent decision-making.

Through the efforts of the Screening Committee, a positive relationship between the Inuvialuit, industry, government and the EISC, has emerged.

Brian Johnson

Wildlife Management Advisory Council (North Slope)

With members representing the Inuvialuit and the governments of Canada and the Yukon, this five person Council is the Yukon counterpart to the WMAC (NWT). It is responsible for advising federal and territorial ministers on all on all matters related to the conservation of wildlife, habitat and Inuvialuit use on the Yukon North Slope.

As established by the Inuvialuit Final Agreement, the Yukon North Slope falls under a special conservation regime which includes two wilderness parks: Ivavik National Park and Herschel Island Territorial Park. The WMAC (NS) is actively involved in the management of these two parks.

The WMAC (NS) has prepared a Wildlife Conservation and Management Plan, and a Long-term Research Plan for the Yukon North Slope. These plans help government and the Inuvialuit implement the special conservation regime for the area.

Similar to the FJMC and the WMAC(NWT), the WMAC (NS) makes recommendations to the Government on wildlife and habitat research. Since its formation the Council has supported research on a number of species including caribou, muskox, grizzly bears, waterfowl, Dall sheep and wolves. The Council has also supported ongoing ecological monitoring and critical habitat mapping projects.

In all its activities, the Council has worked to facilitate cooperation between the Inuvialuit and the governments of Canada and the Yukon. Inuvialuit have assisted with wildlife research and in the development and implementation of wildlife and park management plans. Every three years, in cooperation with the Yukon Government, the Council organizes the North Slope Conference to address matters of public interest in the area.

Environmental Impact Review Board

The Environmental Impact Review Board (EIRB) has a Chair and six members. Three of the members are appointed by the Inuvialuit Game Council. The governments of Canada, the Yukon and the Northwest Territories also each designate one member and Canada appoints the designated members. The Chair is appointed by the Government of Canada with the consent of the Inuvialuit Game Council.

If the Environmental Impact Screening Committee determines that a project could have potential significant environmental impacts, the project is to be subject to an assessment and review. The EISC can refer the project to an existing or planned governmental development or environmental impact review process provided that it meets the requirements of the IFA, if not the EISC is to refer the project to the EIRB.

The EIRB initiates the public phase of environmental reviews by inviting the general public to participate in the review process. The public can participate in a number of ways, including by registering as an intervener and participating at a public hearing. These public hearings usually occur in the community most affected by the proposed development.

After gathering its information, the EIRB will prepare a final report with its recommendations to be submitted to the federal authority. The federal authority will choose to accept, alter, or reject these recommendations. No permit or license shall be issued without final approval.
